Agenda

Windows Server 2025 Storage

Accelerate Mission Critical Workloads

Optimize for NVMe Storage

Improved performance

Lower CPU utilization

Reduce Storage Costs

Coming soon to Windows Server 2025

Full stack, Native NVMe Support

- WS2025 delivers up to 70% more IOPS on NVMe SSDs
- After GA, WS2025 will bring up to 90% more IOPS
- This innovation in full stack NVMe
 - Lowers host CPU consumption = More VMs per node
 - Increases IOPS = increased performance per VM

NVMe-oF Initiator

- Built-in NVMe-oF client for connecting to NVMe SANs
- Enables additional storage topologies
- TCP for traditional workloads
- Roadmap: RDMA support for lowest latency workloads

25% of Enterprises will deploy NVMe-oF solutions by 2027

Gartner - Top Trends in Enterprise Data Storage 2023

WS 2025 delivers up to 90% more IOPs on NVMe SSDs

with future Native NVMe Enhancements

1.1M IOPs

2.1M IOPs

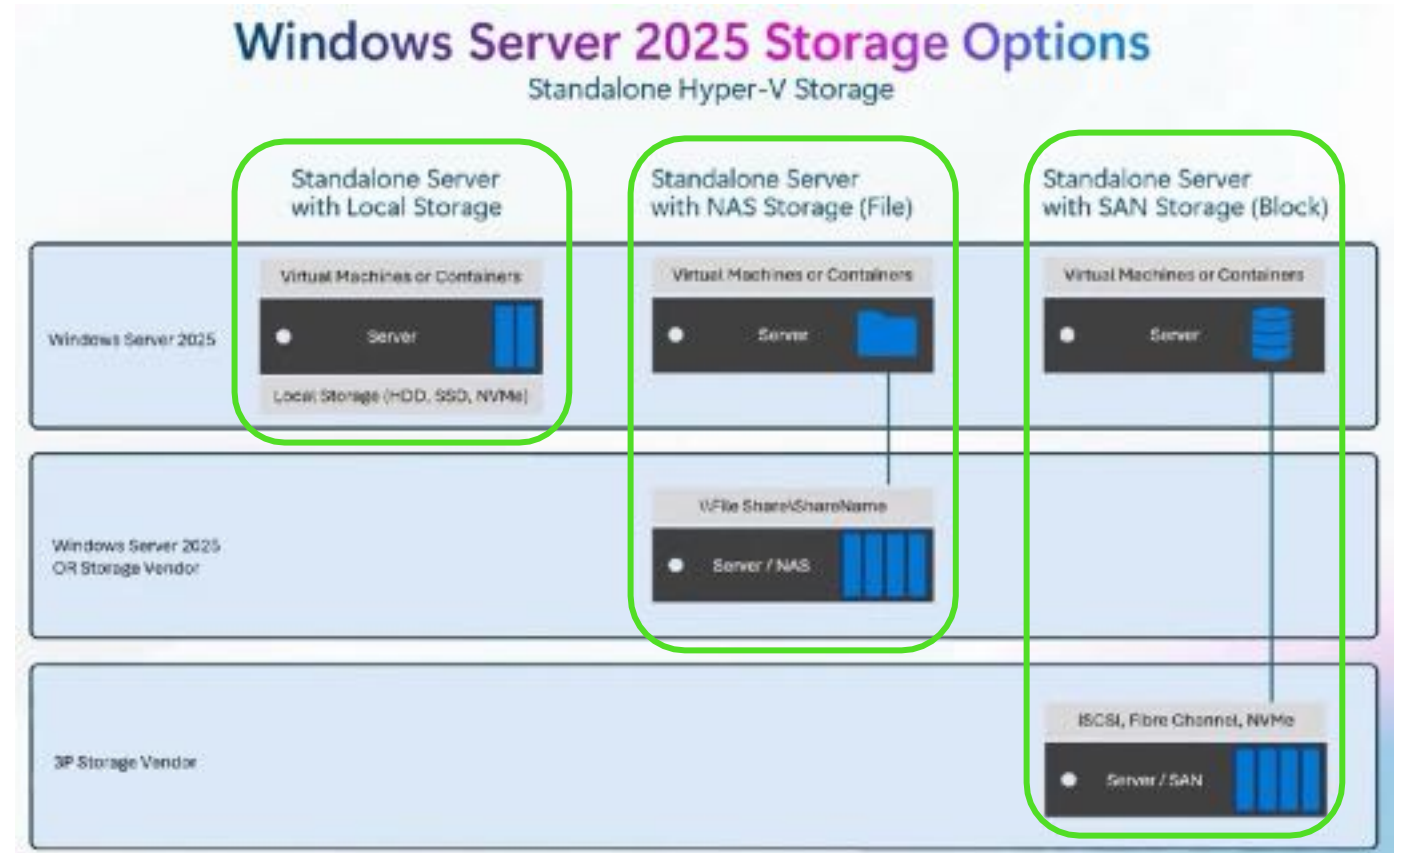

Single device, running a synthetic IO workload with 8 threads, queue depth 64.

Storage Options

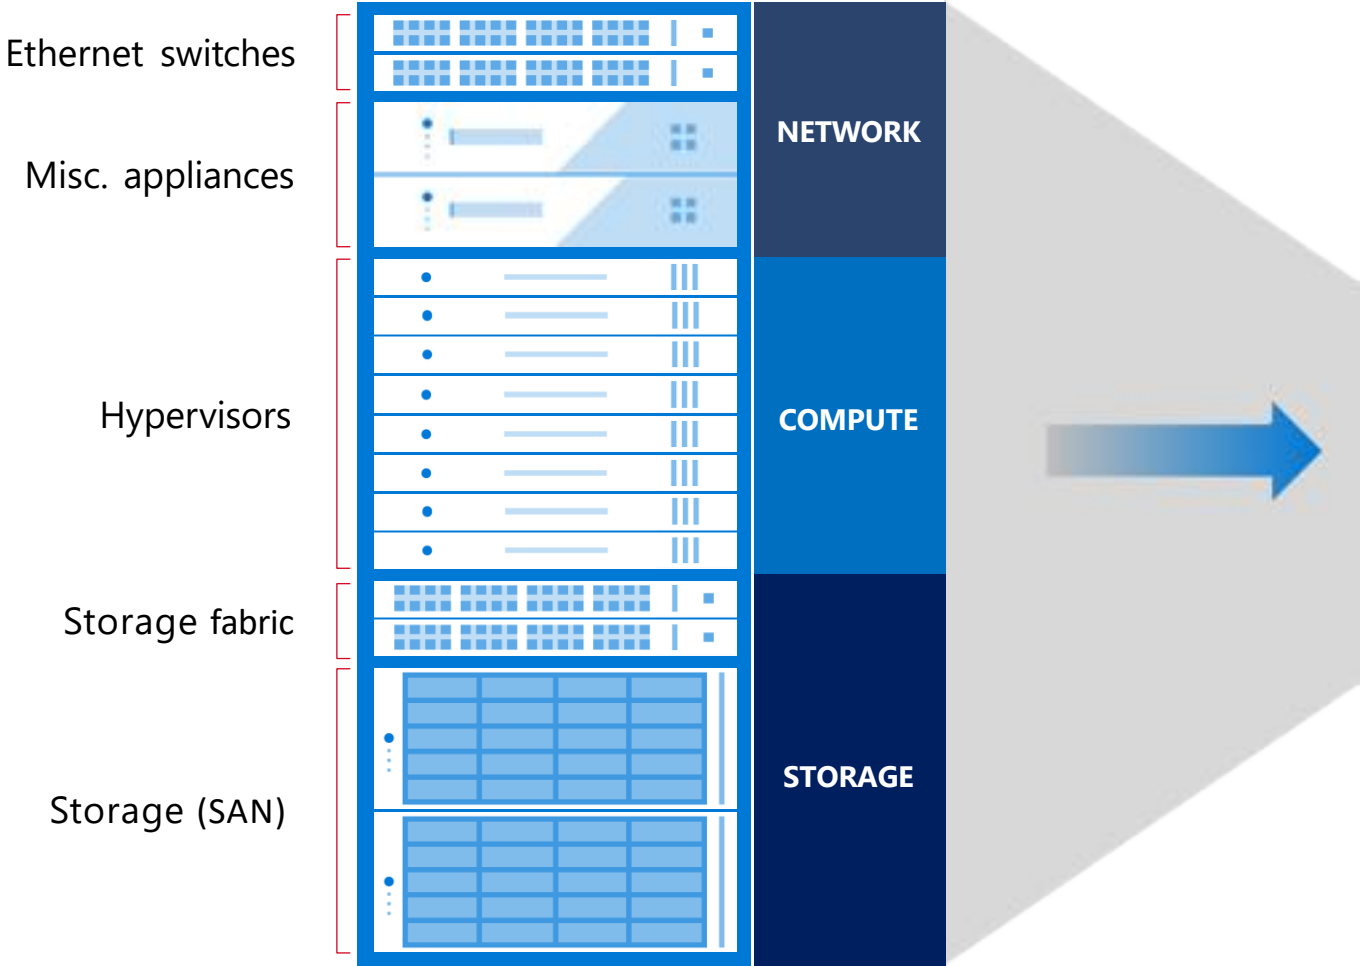

Standalone Server Storage Options

- Standalone Server
 - Local Storage
 - NVMe, SSD, HDD
 - RAID-Controller
 - Storage Spaces
- Standalone Server with SMB Storage
 - NAS (with SMB3 Support)
 - File Server
- Standalone Server with SAN
 - iSCSI, Fibre Channel, NVME-oF

Classic Cluster-Storage and Hyper-Converged infrastructure

Legacy "three tier" infrastructure

Hyperconverged infrastructure (HCI)

HCI is a software-defined, unified system that combines all the disparate and siloed elements of a traditional datacenter

Cluster Storage Options

Hyperconverged Infrastructure

Scale-out Storage

SAN Storage

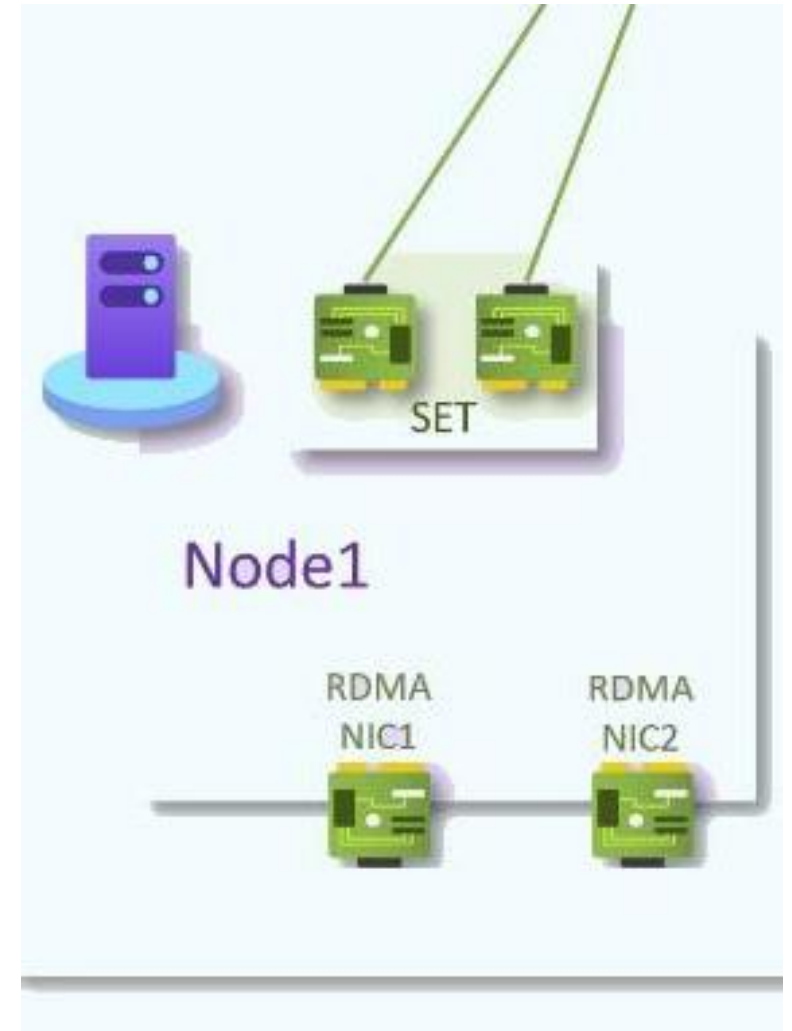

Single Node Cluster

The background features a smooth gradient from white on the left to a mix of orange and blue on the right. A prominent, thick, curved orange line arches across the upper right portion of the image.

Single Node Cluster

- Windows Server 2025 Single Node S2D Cluster
 - Local Storage Spaces Direct
 - Needs only two Flash Devices
 - Distribution of Extents over Storage Devices
 - easily expandable to more nodes, incl. recalculation of Storage Resiliency
 - Supports VMs and Containers

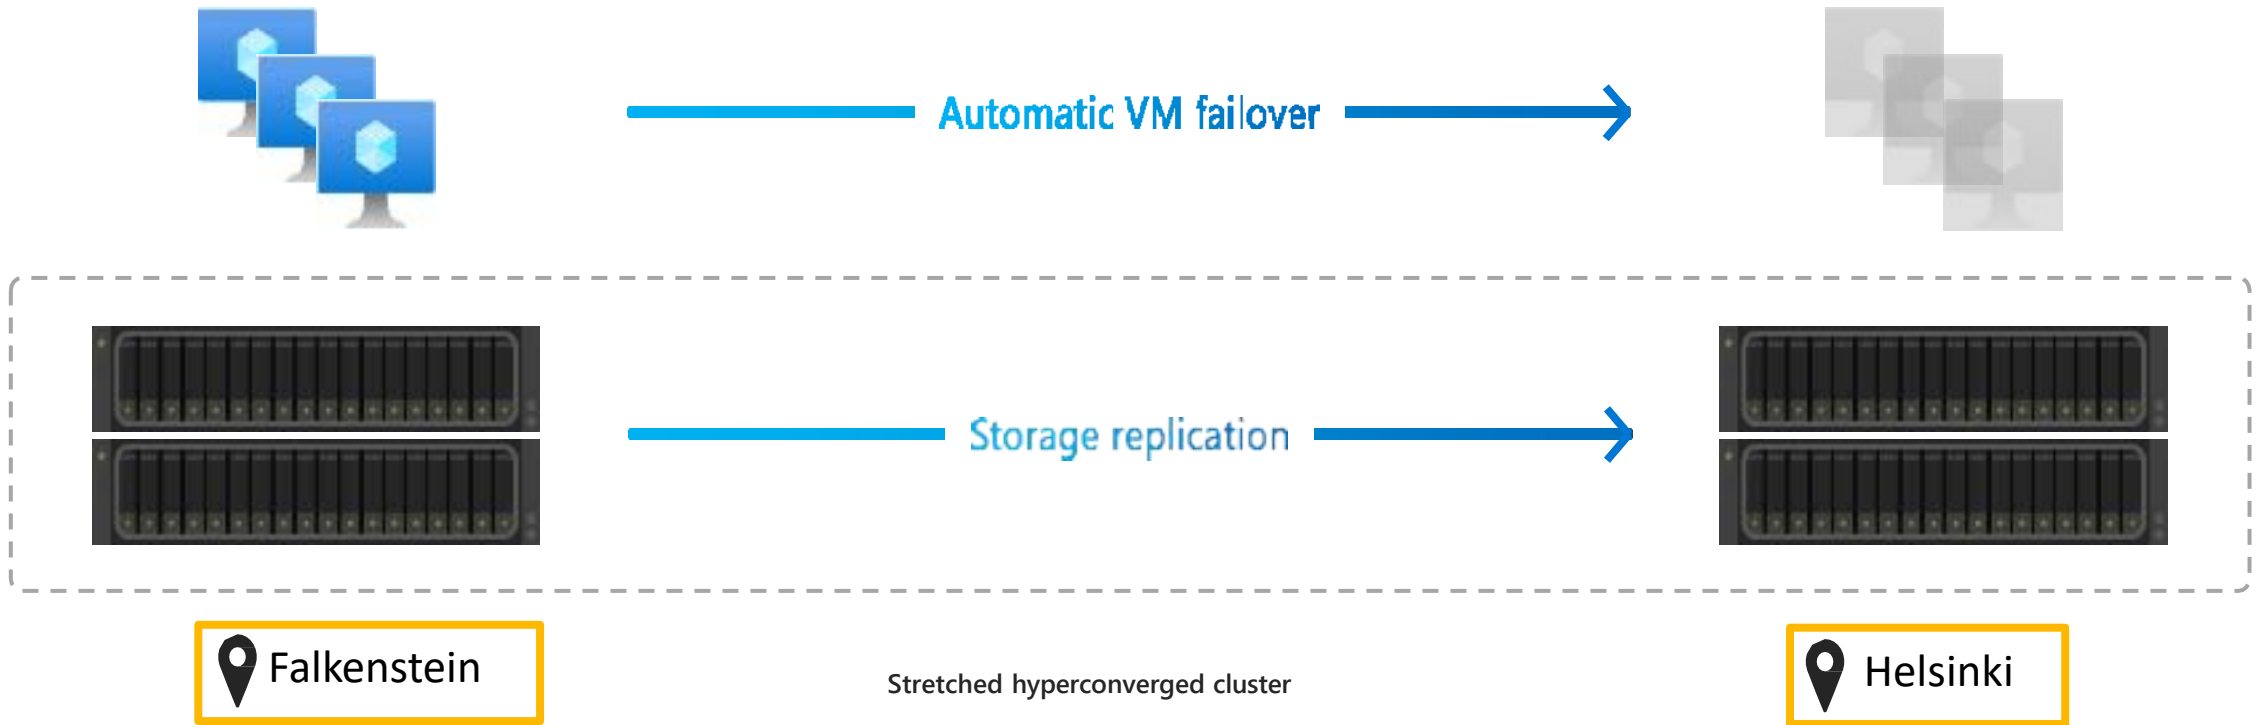

Stretched Cluster

The background features a large, curved orange line that starts from the bottom left and arcs towards the top right. Below this line, there is a gradient of colors transitioning from purple on the left to blue on the right. The overall aesthetic is clean and modern.

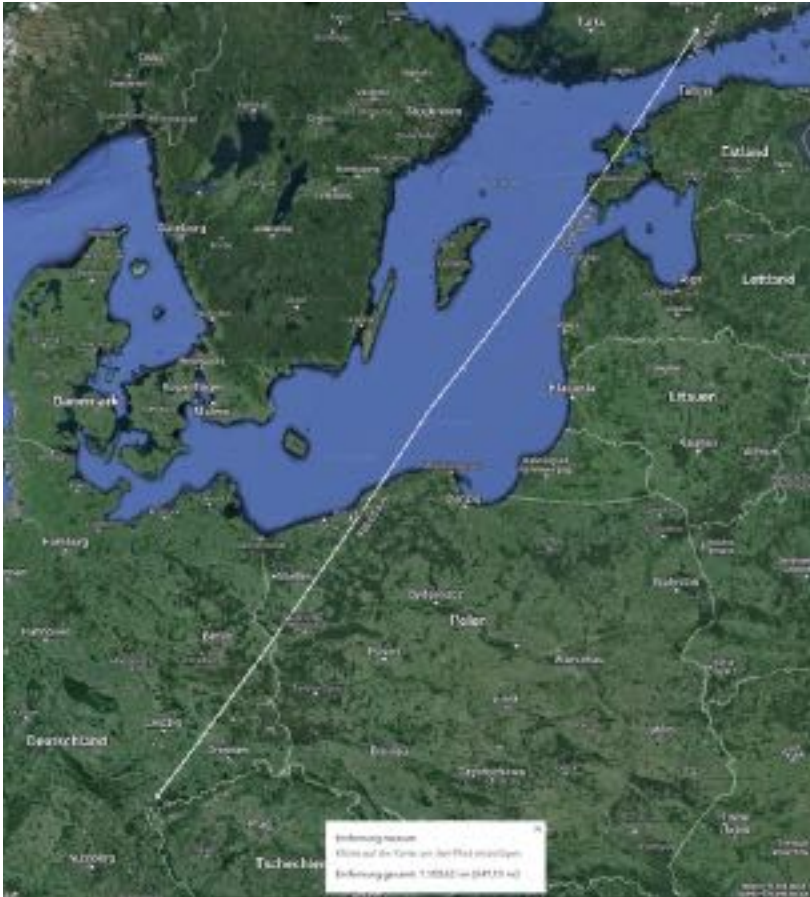

Stretched Cluster

What is a Stretched Cluster for Microsoft?

Stretched Cluster

Metro Cluster

- Distance of the sites many hundreds to thousands of kilometers
- Network between sites usually via WAN or leased connections
- Network speed between 1 Gbit/s and 20 Gbit/s
- Mostly Layer 3 connections
- Little or no redundancy in network paths
- Different IP ranges for the workloads (Re-IP)
 - Metro Stretched S2D Cluster
 - Stretched Support like ASHCI
 - Storage Replica as technology
 - Synchronous or Asynchronous
 - Improved performance through new raw log
 - Support for Clusters with 4 to 16 Nodes
 - Evenly distributed over 2 sites (2-2, 3-3, ...)
 - Witness on third Site or Azure

Stretched Cluster

Campus Cluster

- Sites on the same campus a few meters to kilometers away
- Own network infrastructure, often with dedicated switches
- High Speed Ethernet (\Rightarrow 20 Gbit/s) network between sites
- Mostly Layer 2 connections
- Many redundant network paths
- Same IP ranges for the workload

- Campus Stretched S2D Cluster
 - Uses Extent Distribution as Redundancy Technology in S2D
 - Always synchronous
 - Simpler network design
 - Storage traffic in the same subnet
 - No routing necessary but possible
 - Support minimum for 2 and 4 node clusters (maximum 16 nodes)
 - Evenly distributed over 2 sites (1-1, 2-2, ...)
 - Witness in third room or Azure

Thin Provisioned Cluster Volumes

The background features a large, thin orange arc that curves from the top right towards the bottom center. Below this arc, there is a gradient area transitioning from purple on the left to blue on the right, with a yellowish-orange hue at the bottom.

Thin Provisioned Volumes

- Allows over-provisioning
- Extents are only assigned when they are occupied
- can be converted from “Fixed” to “Thin”
- can be selected for individual volumes
- can be set as default in the storage pool settings

The screenshot shows the 'Create volume' configuration window. The 'Name' field is set to 'Volume01'. The 'Resiliency' is set to 'Two-way mirror'. The 'Size on SSD' is set to '500' and the 'Size units' are set to 'GB'. The 'Maximum volume size on SSD' is 64 TB. The 'File system' is 'CSVFS_BFS'. The 'Provisioning type' is set to 'Thin' (selected with a radio button). The 'Integrity checksums' section has a checkbox for 'Use integrity checksums' which is unchecked.

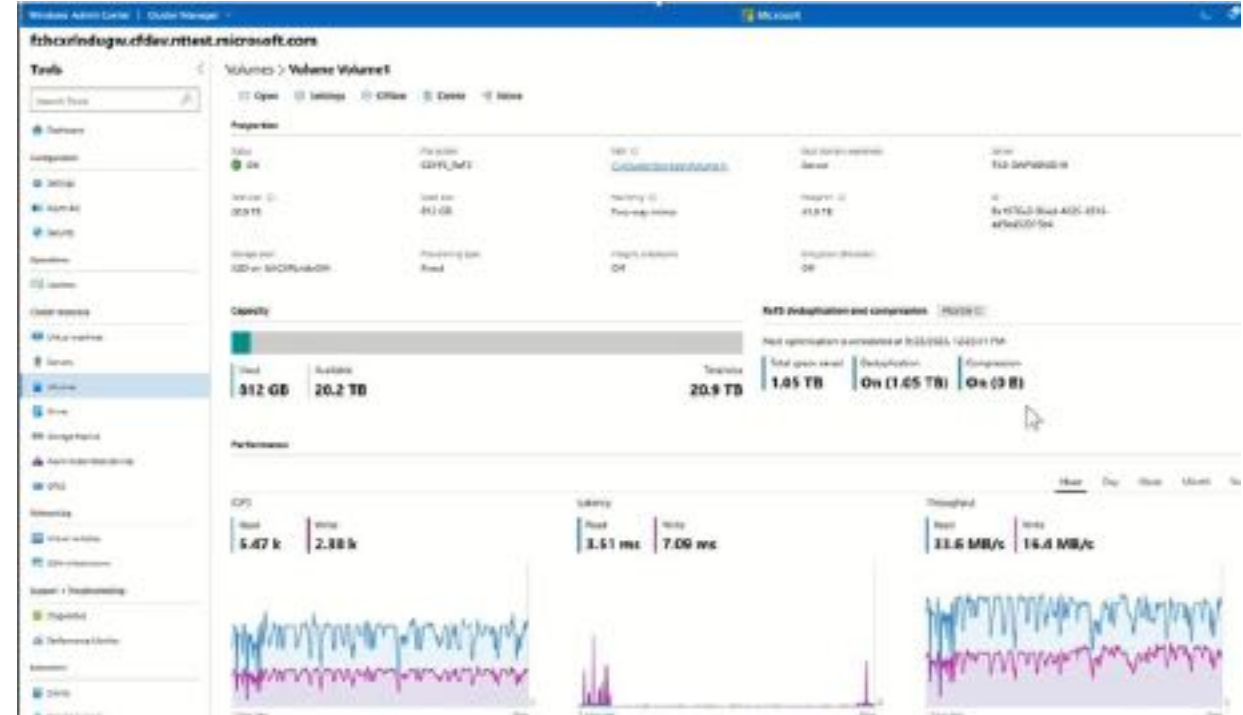

The screenshot shows the 'Storage pool: SU1_Pool' configuration window. The 'Status' is 'Online' (indicated by a green checkmark). The 'Health status' is 'Healthy'. The 'Storage pool friendly name' is 'SU1_Pool'. The 'Storage pool version' is 'Windows Server 2012'. The 'Default provisioning type' is set to 'Thin' (selected with a radio button). The 'Capacity alert threshold' is set to '90%'.

ReFS Deduplication and Compression

The background features a smooth gradient from white on the left to a mix of orange and blue on the right. A prominent, thick, curved orange line arches across the upper right portion of the image.

ReFS Deduplication and Compression

- Saving Storage Space
 - Over 60% space savings in virtualization, backup and file server workloads
- Easy management
 - Windows Admin Center or PowerShell
 - plan, monitor and start the optimization
- Smart and efficient
 - Cluster aware, low overhead (<1 ms)
 - Deduplicates only new or changed data
- Multiple modes
 - Deduplication only, compression only, or both (default)
 - Compression has two different algorithms

Summary Storage Enhancements

Storage Replica

Performance enhancements with enhanced log

SR compression now available in all editions of Windows Server

ReFS

ReFS Native Deduplication and Compression

File Servers: Save ~60% of storage

VHD/ISO/Backups: Save ~90% of storage

Storage Spaces

Thinly Provisioned Storage Spaces

Stretch Cluster Support

Hyper-V: Robust hardware-based virtualization and isolation

Azure Hypervisor System

Azure Stack Family

Windows Server/Windows

Containers with Hyper-V Isolation

Platform Security

Xbox

Hyper-V & AI / GPUs

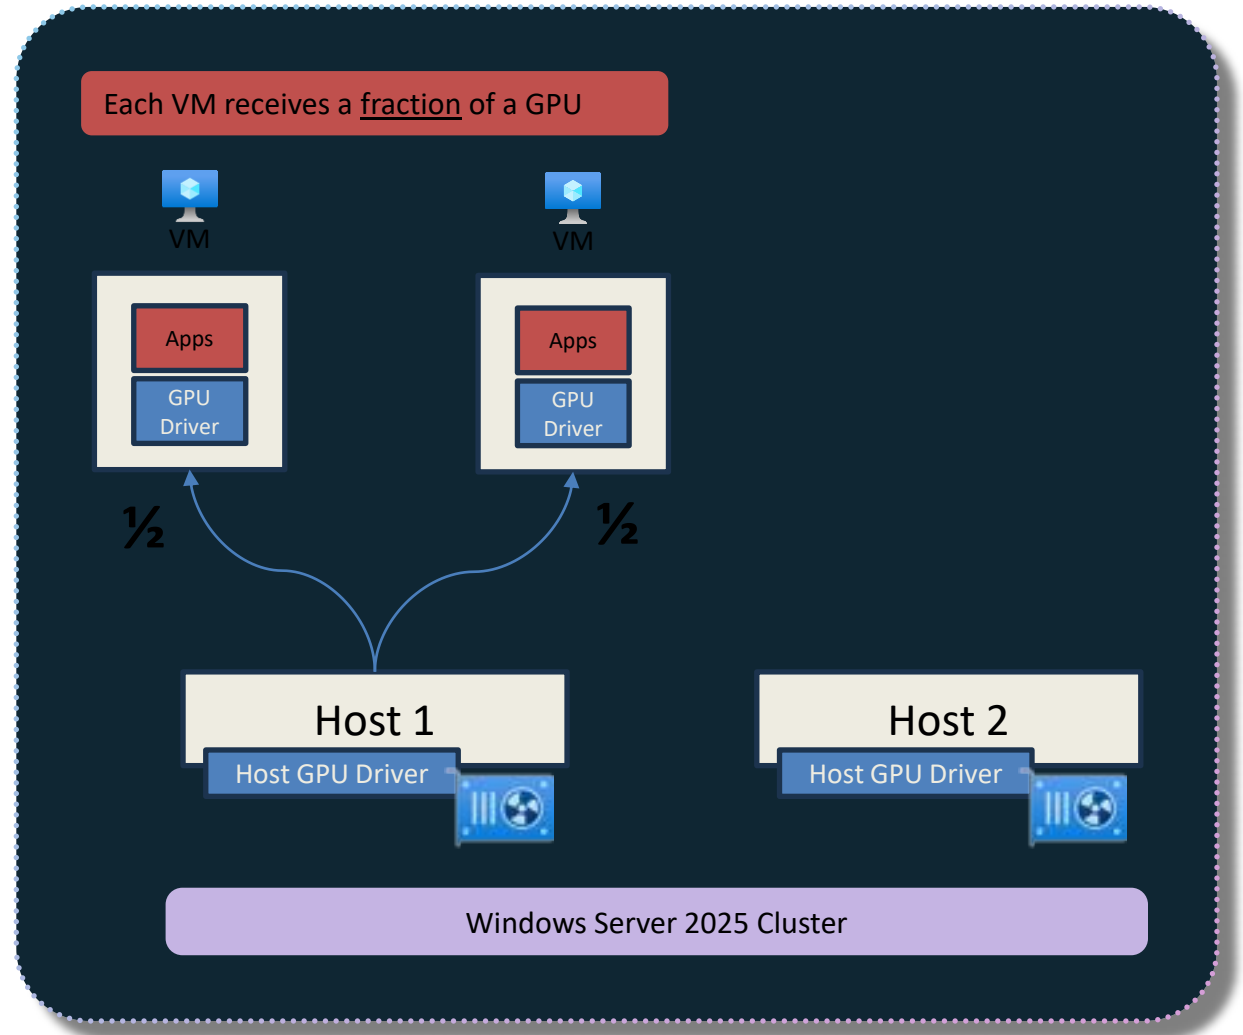

Windows Server 2025 GPU-P Support

GPU Partitioning (GPU-P)

Share a GPU across multiple VMs

- Create GPU Partitions
- Assign each partition to a VM that supports a set of users (multi-session)
- PS or WAC management

Support for Live Migration and failover clustering

GPU-P – Hardware & Live Migration

GPU-P Server Requirements

SR-IOV required

AMD Milan or later

Intel Sapphire Rapids or later

GPU Requirements

nVidia A2, A10, A16, A40 GPUs (Symmetric)

<https://docs.nvidia.com/grid/15.0/grid-vgpu-release-notes-microsoft-azure-stack-hci/>

GPU-P

Both Live Migration & High Availability Supported

Live Migration Scenarios for GPU-P

Works in a clustered environment

Works with standalone servers

(outside of a cluster)

Live migrate from one standalone host to another standalone host

Supported Guests

Windows 10/11

Windows Server 2019/2022

Linux Ubuntu 18.04 LTS, 20.04 LTS

Dynamic Processor Compatibility

Scale out with confidence

No need to order last-gen hardware for compatibility

+

3rd Gen
Intel® Xeon® Scalable
processors

4th Gen
Intel® Xeon® Scalable
processors

← Same Windows Server 2025 cluster →

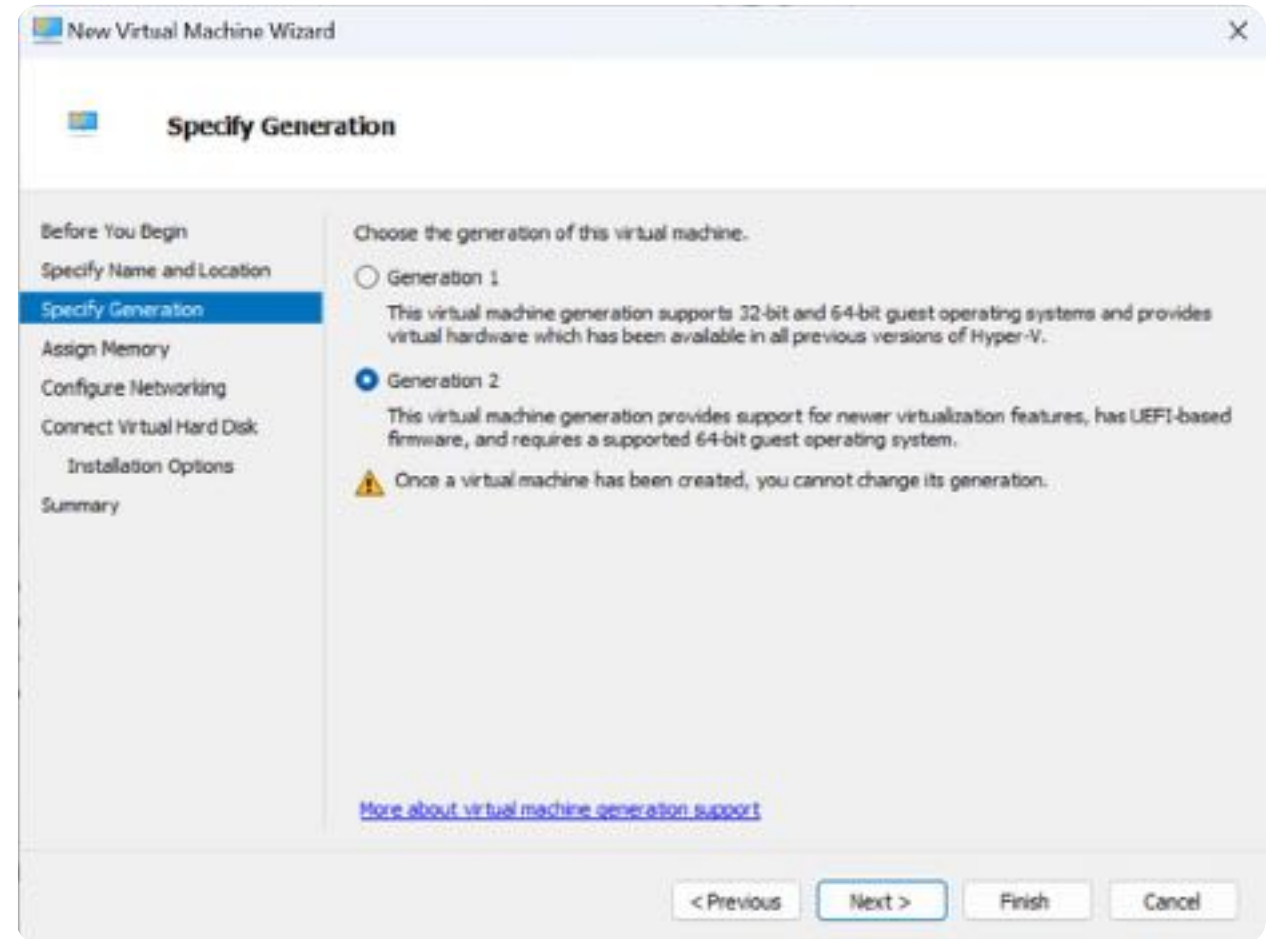

Embrace Generation 2 VMs

Use Generation 2 VMs at this point

Generation 2 VM advantages:

- **Better performance**
 - Supports more VPs (240 vs 64)
- **Improved Security**
 - Secure Boot & TPM support
 - UEFI FW support
- **Dynamic Features**
 - Hot Add/Remove vNICs

GUI's now default to Generation 2 VMs

Networking

Networking

Network ATC

One-click deployment and drift remediation of host network configuration across the cluster

Network HUD

Always-on alerting and remediation of operational network issues and inefficiencies

SDN Multisite

Native L2 & L3 Connectivity for workloads in multiple locations.. Parity with stretch clusters

Unified network policy management for these workloads.

Eliminates need to update policies when workloads move across locations

SDN Gateway Performance Improvements

20%-50% performance improvements with lower CPU utilization

Empowering Modern AKS Applications

Secure, scalable & Adaptive SDN infrastructure for Hybrid AKS

Hybrid AKS workloads can now be put on SDN networks for Windows Server

Enforce customer network policies & routing rules for microservices & applications

Introducing
Arc-enabled Windows Server 2025 Hotpatching

- Arc-enable your Windows Server
Standard or Datacenter Edition
Physical, Virtual, other clouds
- Enable Hotpatching via Azure Portal
Monthly subscription
- Hotpatching on Azure/Azure Stack
properties included at no additional
cost when using Windows Server Azure
Edition

Arc-enabled Hotpatching Everywhere

Mission Critical: Hotpatching with Windows & SQL Server

Xbox Footprint (partial)

- 1000 Servers running 18 different services
- Each services running between 2-120 SQL Servers; Some workloads running for 15+ years
- Workloads used to be physical, now Azure VMs

Before Hotpatching

3 weeks every month to roll out updates without downtime; 12 times a year.

With Hotpatching

1000 servers patched in <48 hours without downtime

Hotpatching Demo

The background features a white-to-orange gradient on the left and a blue-to-purple gradient on the right. A thick, curved orange line separates the two gradients, starting from the bottom left and curving upwards and to the right.

Windows Server 2025 Upgrade Pfade

Easiest Upgrades EVER!!

Upgrade from Windows Server 2022 to 2025 with Windows Update

Same great experience you are used to on Windows 11

Makes Upgrading to Windows Server 2025 simple!

Vielen Dank für Ihre Aufmerksamkeit!
